Executive Summary

This is a report on the meeting held 11 - 12 November 2014 in Chongqing, China to update the analysis of the *ex situ* population of giant pandas and develop breeding recommendations for the 2015 breeding season. This is the 13th annual set of genetic management recommendations developed for giant pandas.

The current *ex situ* population of giant pandas consists of 396 animals (179 males, 216 females, 1 unsexed panda) located in 72 institutions worldwide. In 2014 there were 34 births, 10 deaths and 1 release to the wild. Transfers included 53 transfers of animals between Chinese institutions, 4 exports from China (to Malaysia and Belgium), and 3 imports to China from the US.

The genetic status of the population is currently healthy (gene diversity = 97.4%), with 54 founders represented and another 10 that could be genetically represented if they were to successfully breed. There are only 5 inbred animals with inbreeding coefficients > 4% in the population.

There are 48 giant pandas in the studbook that are living or have living descendants and for which the sire is uncertain. Most of these are pandas that were born in 2006 or later and are the result of natural mating and/or artificial insemination with multiple males. The result is that 9% of the gene pool of the *ex situ* population is derived from uncertain ancestry.

Molecular genetic analyses must continue to be used to confirm the parentage of these pandas as well as each year's new cubs before the next set of genetic management recommendations is made. This report contains the list of giant pandas that need to have their paternity verified (see page 12). Plans should continue to resolve as many of these uncertainties within the next year as possible.

Population growth in 2014 was 7%, which allows for some growth while implementing stronger genetic management. Growth focused on breeding genetically valuable animals as part of the genetic management strategy to preserve genetic diversity and minimize inbreeding, with some additional breeding targeting production of pandas for eventual potential release.

The current population goal for the giant panda *ex situ* population is **to maintain a target population of 400-600 giant pandas that retains at least 90% gene diversity of the wild population for 200 years**. A population of this size and genetic composition should be able to provide animals for reintroduction efforts if needed in the future.

***Ex Situ* Giant Panda Management Program**

Introduction

This is a report on the meeting held 11 - 12 November 2014 in Chongqing, China to update the analysis and breeding plan of the *ex situ* population of giant pandas. Workshop participants updated the studbook and identified the female pandas to be bred in China in 2015 and the males (or sperm) with which they should breed. The meeting was organized by the Chinese Association of Zoological Gardens (CAZG), the Chengdu Research Base for Giant Panda Breeding, and the Chongqing Zoo, and the technical workshop was facilitated by the IUCN SSC Conservation Breeding Specialist Group (CBSG).

The goals of the technical workshop were to:

- update the demographic and genetic analyses of the *ex situ* population; and
- formulate recommendations for breeding and management to promote these goals.

Population Goals

In 2009 the Technical Committee revised the program goal to maintain at least 90% gene diversity for 200 years with a target population size of approximately 500 (400-600) giant pandas. A longer timeline was adopted due to the uncertainty surrounding the possible significant threats of climate change and habitat destruction. The rate of growth toward this new target size can be slowed, and increased effort will be placed in genetic management and natural reproductive and parental behaviors. Genetic management is the most effective method of maintaining a genetically viable *ex situ* population capable of supporting a wild panda population. The current population of 396 giant pandas needs to increase by 104 to reach the goal of 500 pandas (Figure 1).

Figure 1. Growth of the *ex situ* giant panda population from 2000 to 2014.

Status of Captive Population

Data Analysis and Pedigree Assumptions

Data were taken from the 11 November 2014 version of the *International Giant Panda Studbook* compiled by Xie Zhong, CAZG, using the ISIS Single Population Analysis and Record Keeping System (SPARKS) v1.66 software program. PMx v1.2 software (Ballou, Lacy and Pollak) was used to conduct both demographic and genetic analyses. Data were current through the day of the workshop, as the studbook was updated during the workshop by institutional representatives.

Paternity is uncertain for many animals in the studbook. For many of these cases, females were first mated naturally and were then artificially inseminated. In others, lack of record-keeping in the early studbook years resulted in uncertainty about which males sired which cubs. Although molecular analyses have successfully identified the paternity of many pandas, there are still 48 pandas with uncertain paternity that affect the living gene pool, many of which were born between 2006 and 2014 (listed in Appendix B). The uncertain paternity of these individuals results in 9% of the living gene pool being uncertain.

SPARKS v1.66 provides the option to list the studbook numbers of the potential sires along with the probability of each of them being the real sire. These uncertain sires can then be exported to PMx, where the pedigree analysis will take into consideration the uncertainties and calculate the kinships based on the estimated paternity across the uncertain sires (see Lacy *et al.* 2011 for the methods).

While the ability to include such uncertainty in the analyses are useful, and even necessary to proceed with developing breeding recommendations, the genetic analyses for this *ex situ* population will not be completely accurate until the paternities are known for certain through molecular genetic analyses. Accurate paternity verification will affect both population genetic measures (e.g., gene diversity, number of founders) as well as individual genetic measures (mean kinship, MSI scores).

Molecular analyses are needed to resolve the paternity of these 48 pandas as soon as possible since genetic management recommendations will not be accurate with these unknowns in the pedigree.

Demographic Status

The current *ex situ* population of giant pandas consists of 396 animals (179 males, 216 females, 1 unsexed panda) located in 72 institutions worldwide. In 2014 there were 34 births, 10 deaths, and 1 release to the wild.

Reproduction over the last several years has resulted in an annual population increase of 9-15% for 2005 to 2010. The growth rates were lower in 2011 (5%) and 2012 (3%) – presumably due to the increased focus on producing genetically valuable animals rather than large numbers. The growth rate now is being increased to accommodate the needs of a developing release and reintroduction program, and 7% growth was observed in 2014. The age structure of the living population is healthy and indicative of a population that would be expected to continue to grow (Figure 2). A greater proportion of adult pandas have reproduced, especially females (from 41% in 2002 to 46% in 2014), which contributes positively to growth as well as the effective population size (N_e).

Females are generally reproductive from 5-20 years of age, while male fertility can continue into the 20s. Generation time for the population is 11 years. Litters consist of 1-2 cubs with almost equal frequency (five litters of triplets have been observed), producing a mean litter size of 1.5 cubs. About 50% of males survive to age 15, 25% survive to age 23, and only about 10% survive to age 28; female survivorship is slightly better, with about 50% reaching age 19, 25% surviving to age 28, and 10% surviving to age 34. These values include wild-caught pandas whose ages are estimated.

Figure 2. Age and sex structure of the 2014 population. Dark blue are breeding age individuals; light blue are immature (at bottom) or post-reproductive (at top) pandas; yellow is the unsexed individual.

Genetic Status

The *ex situ* giant panda population has descended from 54 wild-acquired founders (founders are defined as animals obtained from the wild that have successfully produced offspring or descendants in the current population). There are an additional 10 wild-acquired pandas that have yet to produce living offspring but have not been excluded due to age or poor health (these are potential founders). The population theoretically contains 97.4% of the genetic diversity of the wild population. This level of genetic diversity has a founder genome equivalent (*FGE*) of 19.1, which means that the population has the same level of genetic diversity as a population newly established with 19 unrelated founders. The genetic contribution of founders is highly skewed, with 26% of the gene pool derived from only 4 founders (Figure 3). The level of genetic diversity in the population could be increased to 99% if the population was ideally managed and the genes from the additional 10 founders fully incorporated into the population. The population would then have a founder genome equivalent of 54 (Table 1). Managing the population to minimize average kinship has been shown to be the optimal method for retaining genetic diversity. Managing by mean kinship will automatically identify descendants from the under-represented founders as priority breeders and inhibit the breeding of over-represented founders.

Table 1. Genetic summary of the 2014 *ex situ* population.

| | |
|---|--------|
| # Founders | 54 |
| # Potential (additional) | 10 |
| Gene Diversity Retained | 0.9738 |
| Potential Gene Diversity Retained | 0.9908 |
| Gene Value | 0.9733 |
| Founder Genome Equivalents (<i>FGE</i>) | 19.07 |
| Potential <i>FGE</i> | 54.12 |
| Mean Inbreeding | 0.0022 |

Figure 3. Genetic contribution of the 54 founders to the *ex situ* population gene pool. Each bar shows the contribution of a single founder. About 16% of the gene pool derives from only two founders (the left-most founders: 308 and 287). About 50% derives from only 10 founders.

Current inbreeding levels in the population are low, with only 5 inbred animals with inbreeding coefficients over 4%. While the current population is genetically healthy, pandas within institutions are closely related and it is becoming increasingly more difficult to identify non-related pairings within institutions. Of the 20 living inbred animals, 14 were born in the last two years (2013 and 2014). Inbreeding will increase as captive breeding increases and the influx of new founders from the wild remains proportionally low. This will be especially true for pairings within institutions, making the transfer of individuals among institutions for breeding more important in the future as a way to minimize inbreeding and the loss of gene diversity. In the near future, giant pandas, or their sperm, will need to be transferred among institutions to increase the number of genetically favorable breeding options in the primary breeding centers. This process is beginning, with 53 transfers of giant pandas between Chinese institutions in 2014.

2015 Breeding Recommendations

Since 2010, the focus on breeding has shifted from being concentrated on rapid demographic growth (high quantity breeding) to greater emphasis on genetic management (high quality breeding). There is less need for population growth to maintain a healthy *ex situ* population, so fewer cubs will be needed, and more emphasis can be placed on breeding pairs with low MSI (Mate Suitability Index – see Appendix D) scores and individuals with low MK values to promote retention of gene diversity in the population. The recommendation is to breed pairs with MSI scores of 4 or less. Greater emphasis should also be placed on producing cubs from the 10 potential founders (wild-caught giant pandas) that have not yet reproduced as well as more genetically valuable (rare) family lines.

This breeding strategy was well implemented for the 2012 to 2014 breeding seasons. The MSI scores for the 2012 and 2013 pairings that resulted in cubs produced ranged from 1 to 4, with two-thirds with MSI from 1 to 3. In contrast, only about 40% of the litters produced in 2014 were from MSI of 1-3. Continuation of the strategy to breed pairs with low MSI scores and individuals with low MK values will result in the maintenance of a high level of gene diversity in the population.

At the 2014 Chongqing technical meeting, specific breeding recommendations were made for 65 females in 10 Chinese institutions (involving 50 different males) plus one female abroad using sperm from China. These recommendations are shown in the following table. The full MSI tables for all potential pairings are presented in Appendix D and can be used by other breeding institutions to determine best mates for their females, or evaluate the MSI scores of the pairs in their collection.

Priority was placed on breeding genetically valuable females (ones with low MK values) with genetically good males (low MSI scores for the pair and/or low MK values). Almost all of the recommended breeding pairs had an MSI score from 1 to 4. Special consideration was given to instances in which males of high genetic value (e.g., potential founder) have limited opportunities for breeding, and recommendations were made to breed these males even if the only potential female mates are of moderate to low genetic value (these pairs were given an MSI of 3f or 4f). To improve genetic management some breeding age females were not recommended to breed in 2015; these were usually females of low genetic value to the population (have many relatives and are descendants of over-represented founders). In some cases, lower ranking females were recommended to breed to produce offspring as part of the developing release program.

Note that the following table is for breeding recommendations in China. Additional pairs outside of China may be bred in 2015 but are not listed in this table (except for Toronto) and are not highlighted in blue on the mean kinship list in Appendix C.

Table 2. Breeding recommendations made at the 2015 technical meeting for giant pandas in China (or using sperm exported from China).

APPENDIX A: Assumptions about breeding population for analysis.

Data were taken from the 11 November 2014 version of the *International Giant Panda Studbook* compiled by Xie Zhong, CAZG, using the ISIS Single Population Analysis and Record Keeping System (SPARKS) v1.66 software. SPARKS v1.66 and PMx v1.2 software (Ballou, Lacy and Pollak) were used to conduct demographic and genetic analyses. Demographic characteristics of the population were analyzed for the period from 1 January 1990 to 11 November 2014. Genetic analysis was performed on the global living captive population. It is important to document the methods used in conducting the genetic analyses so that they can be repeated in future years.

This year 28 living pandas were excluded from the genetic analysis due to old age or chronic poor health, or because they are scheduled to be released into the wild; these pandas are listed in the table below. These pandas were excluded because they are not considered to be able to breed in captivity in the future and therefore can no longer contribute to the genetic diversity of the captive population. This left 368 pandas in the genetic population analysis.

| SB # | Location | Sex | Age | Reason excluded |
|-------------|-----------------|------------|------------|------------------------|
| 230 | ABERDE HK | Female | ~36 | Too old |

APPENDIX B: Giant pandas with uncertain paternity.

Assumptions about Paternity

Often in captivity female pandas are both naturally mated and artificially inseminated with two or more males to maximize the probability of conception. There are 38-48 pandas in the studbook with uncertain paternity and that are still living and/or have produced offspring (see table below; animals with uncertain paternity but that died young before they bred have been excluded). Many of these are recent births (born 2006 to 2014).

For animals with uncertain sires, all of the potential sires and the probability of each male being the true sire were entered into the studbook. The probability that a potential sire was the true sire was based on the following rules:

1. When a female was mated with multiple males using only one mating method – either only by natural matings (NM) or only by artificial inseminations (AI), equal probabilities were assigned to all potential sires.
2. When a female was mated using both NM and AI: In past cases, molecular genetic analyses showed that the male that was used for NM in almost all cases was the confirmed sire. Each sire mated by AI was given a 2% chance of being the true sire.
3. In cases of both NM and AI breeding methods, all males within the same method were given the same probability of being the true sire.
4. The sum of all probabilities for all potential sires for an animal = 100%.
5. In some cases, different probabilities had been entered previously into the 2013 International Studbook prior to analysis based on additional information; these probabilities were kept for analysis.
6. For 8 animals that were born before 2002 when the first population analysis was conducted, there is no information available on mating method (NM or AI), but a male was selected as the sire. For these animals, this sire was kept for analysis.

Examples:

A: ♂ 201 (AI) and ♂ 202 (AI)
201 = 50%; 202 = 50%

B: ♂ 174 (NM) and ♂ 201 (AI)
174 = 98%; 201 = 2%

C: ♂ 201 (AI), ♂ 202 (AI) and ♂ 174 (NM)
201 = 2%; 202 = 2%; 174 = 96%

D: ♂ 174 (NM), ♂ 424 (NM) and ♂ 201 (AI)
174 = 49%; 424 = 49%; 201 = 2%

It will be important to resolve these and any future uncertain paternities to accurately evaluate the genetic value of individuals, the relationship between mates, and the status of the population as a whole.

| SB# | Possible sires | Confirmed by molecular genetic analysis? | Relevant notes and information from 2014 studbook | Sires used in analysis |
|-----|------------------------------|---|--|--------------------------------|
| 237 | 150, 186 (?) | No | No note of NM or AI; studbook entered 186 as the sire | 186 ¹ |
| 278 | 174, 201 (?) | 2001 analysis excluded 202 as possible sire | 1991 note says may be 174, 201 or 202; 174 was entered as the sire. No note on which NM or AI. | 174 ¹ |
| 297 | 174 (NM); 201, 202 (AI?) | ?? | 2001 note used 174 as sire due to NM; 174 listed in 2014 studbook | 174 ² |
| 314 | 174, 201, 202 (AI?) | No | 1991 note used 201 but says may be any of these. Note says this was the first successful use of frozen semen. | 201 ¹ |
| 320 | 135, 149 (?) | No | 1991 note says sire may be 135 or 109, but likely typo indicating 149; 149 listed as sire. | 149 ¹ |
| 323 | 150, 186 (?) | No | Note says sire may be 150 or 186. 186 listed as the sire. | 186 ¹ |
| 437 | 308 (NM); 298 (AI) | Sire unresolved by 2001 analysis | 308 listed in 2013 studbook; changed to MULT in 2014 SB | 308 (98%); 298 (2%) |
| 439 | 308, 329 (NM); 298 (AI) | No | 329 listed in 2013 studbook; changed to MULT in 2014 SB | 308 (49%); 329 (49%); 298 (2%) |
| 455 | 308, 329 (NM) | Sire unresolved by 2001 analysis | 329 listed in 2013 studbook; changed to MULT in 2014 SB | 308 (50%); 329 (50%) |
| 495 | 308, 329 (NM) | Confirmed 2001 but disputed? | 2001 analysis indicated sire as 329 but sire of its twin 496 as 308; 329 listed in 2013 studbook; changed to MULT in 2014 SB | 308 (50%); 329 (50%) |
| 507 | 345, 369 (?) | No | 1999 studbook had 369 | 369 ¹ |
| 532 | 377, 394, 399 (?) | No | No comments. 394 listed as sire; changed to MULT in 2014 SB (basis of probabilities unknown) | 394 (60%); 399 (38%); 377 (2%) |
| 538 | 308 (NM), 357 (AI) | No | Sire 308 in 2001 studbook with 357 as AI; 308 listed in 2013 SB; changed to MULT in 2014 SB | 308 (98%); 357 (2%) |
| 539 | 308 (NM), 357 (AI) | No | Sire 308 in 2001 studbook with 357 as AI; 308 listed in 2013 SB; changed to MULT in 2014 SB | 308 (98%); 357 (2%) |
| 547 | 308, 394 (NM); 357 (AI) | No | 394 listed in 2013 studbook; changed to MULT in 2014 SB (basis of probabilities unknown) | 394 (60%); 308 (38%); 357 (2%) |
| 548 | 308, 394 (NM); 357 (AI) | No | 394 listed in 2013 studbook; changed to MULT in 2014 SB (basis of probabilities unknown) | 394 (60%); 308 (38%); 357 (2%) |
| 549 | 308, 394 (NM); 357, 415 (AI) | ?? | 394 listed in 2014 studbook | 394 ² |

¹ Male was listed as the sire in earlier versions of the studbook; however, there is no note on how the male was confirmed as the sire.

² Male was listed as the sire in the 2014 studbook; need to confirm that this was based on molecular genetic analysis.

APPENDIX C: Ranked mean kinship (MK) list for giant panda captive population.

Individual giant pandas are listed in order of genetic value for breeding (males on the left; females on the right; unsexed pandas on both lists, in *italics*). Individuals at the top of the list have small mean kinship (MK) values because their genetic lines are under-represented and therefore are valuable breeders. Individuals with high MK values near the bottom of the list are over-represented in the population. The line in the middle of the list represents the average MK value for the population (0.0262); individuals above this line are underrepresented and are priority breeders to increase gene diversity in the population.

Giant pandas (or sperm samples) in China with breeding recommendations for 2015 are highlighted in light blue. Numbers in red italics by males indicate the number of females for which each male has been identified as a potential mate in 2015. *Caution should be used in using low ranking males (i.e., those near the bottom of the MK list) for multiple breedings.*

APPENDIX D: Giant panda MSI values for mate selection during the 2015 breeding season (distributed at the meeting in Chongqing in November 2014).

Although females were assigned male mates during the Chongqing meeting, there are always circumstances in which identified males may not be available. In that case, we are providing the full MSI table to all institutions so they can, if needed, find other suitable mates if the ones identified are not available. When choosing males, consider the following:

- There is no need to attempt to breed all females; breeding efforts should concentrate on genetically valuable females to produce cubs for the *ex situ* population.
- Pairs with MSI = 1 to 3 should be given breeding priority, especially for institutions with pairing choices, as this will improve genetic diversity and reduce inbreeding.
- Efforts should be made also to breed males and females with low mean kinship (MK) values. The average MK in the population is 0.0262. Animals with MK less than 0.0262 should be preferred breeders to maintain genetic diversity. The MK values are show for each male and female on the MSI tables.
- Efforts should be made to breed any wild-acquired pandas that have not produced surviving offspring.
- Potential founders or other genetically valuable pandas should be bred with other high ranking pandas when possible (MSI < 4). However, it is acceptable to breed potential founders with lower ranking pandas if this is the best or only option for successful reproduction for this highly valuable animal. To identify these special cases, MSI scores greater than 3 for pairs involving potential founders were changed to 3f (if the resulting change in gene diversity is positive) or 4f (if the change in GD ≤ 0).
- AI should be restricted for use only for genetically valuable pairings that must be bred.

The following MSI tables list one row for each male and one column for each female, in alphabetical order by institution. The intersecting cell for a male and female contains the MSI score for that pair. The MK value of each animal is given next to its studbook number. These MK values are color coded according to percentile, with dark green representing the most genetically valuable animals for breeding (low MK value), changing to light green and then yellow in the middle of the MK list, and finally to orange and then red for animals at the bottom of the MK list. Red indicates animals that are genetically overrepresented and should not be bred unless their cubs are needed for demographic reasons (e.g., for release). The studbook numbers for the potential founders are highlighted in yellow to identify them as high priority breeders.

MateRx listings

The PMx software includes the MateRx tool, which is designed and developed to be a genetic tool that will guide population management decisions. For every male/female pair in the population, MateRx calculates a single numeric index indicating the relative genetic benefit or detriment to the population of breeding that particular pair. This index, called the mate suitability index (or MSI), is calculated from considering each pair's mean kinship values, the difference in the male's and female's mean kinship, the inbreeding coefficient of the offspring produced, and the amount of unknown ancestry in the pair. MateRx is designed to simplify the decisions about which pairs should be bred by condensing all that we know about the genetics of a pair into a single number.

MSI values are labeled as beneficial (scores = 1, 2, or 3) or detrimental (scores = 4, 5, or 6) to the population. Beneficial MSIs denote no detrimental effects relative to the genetic values of that pair, and MSI values of 4, 5, or 6 indicate at least one detrimental effect.

MSI Score Definitions:

1 = very beneficial pair;

2 = moderately beneficial pair;

3 = slightly beneficial pair;

4 = slightly detrimental pair;

5 = detrimental pair, should only be used if demographically necessary;

6 = very detrimental pair, (should only be used if demographic

considerations override preservation of genetic diversity, or if this is the only good option for breeding a very highly ranked individual).

“-“ = so detrimental that the pair should never be bred

Note: When one of the animals in the pair is a potential founder (wild-caught animal with no living offspring or descendants) and therefore of high priority for breeding, $\text{MSI} \geq 4$ were revised to prevent the situation where these animals are not bred because their only available mates were of relatively low genetic value (leading to a high MSI). In these cases, $\text{MSI} = 3f$ when the resulting change in gene diversity (GD) is positive, and $\text{MSI} = 4f$ when the change in $\text{GD} \leq 0$.

- Breeding by MSI values does not address demographics, behavior or logistics.
- MSI values are not intended for use with all captive managed species. Many species have unusual population histories and structures that require the expertise and attention of a trained population biologist. These populations may have characteristics such as few founders, many captive generations, extremely small numbers, or many unknown origins or parentage data that prohibit generic management.
- MSI values (and MK values) are time sensitive: the MSI rankings are only valid as long as there are no substantial changes in the population. These MSI tables should be considered invalid after one year following its date of creation.
